OC STEM Initiative

Vision

All students possess the requisite STEM skills to be competitive for 21st century jobs in Orange County

All educators and teachers are provided the tools and support to ensure their students are STEM competent and STEM literate

Orange County is a leader in STEM workforce competitiveness in California and the United States

Vision
Objectives

- Foster Orange County's economic competitiveness and sustainability
- Create effective partnerships between community stakeholders, including but not limited to families, education, businesses, government, and philanthropic, organizations
- Promote STEM competencies across the educational continuum in Orange County from PreK through college
- Prepare our children and future workforce to meet the dynamic requirements of a rapidly changing world
- Produce college- and career-ready graduates who possess critical thinking skills and creativity that enable them to make productive choices in work and life

What Sets Orange County Apart?

Orange County possesses unique attributes to establish itself from an advantageous STEM position.

- **Orange County** believes that the development of a STEM competent workforce and citizenry begin with preschoolers and continues at every step of the education continuum thereafter.

- **Orange County** is a proven global leader of innovation with a competitive edge, housing a large number of pioneering high-tech and biomedical industries plus new industries such as advanced transportation, alternative fuels, medical devices and computer gaming.

- **Orange County's** possesses a diverse population, with multiple ethnicities and a significant foreign-born population.

- **Orange County** offers a uniquely high concentration of research centers and institutes of higher education with STEM education and workforce efforts.
Situation Analysis

Keeping Orange County Competitive and Prepared for the Future – the Need for STEM Competent Students and Workers

STEM permeates Orange County life – from its miles of coastline and many cities, to its Fortune 500 and 1000 companies, to its K-12 public school districts, community colleges and public and private universities. In fact, Orange County has fared better in the Great Recession compared to surrounding counties and the state because of many STEM-related factors such as the county’s role as a leader of innovation, its large number of high-tech industries and global corporations, its leadership in emerging industries, and its high concentration of research and higher education institutes, business incubators and venture capital investments.

Yet, in order to maintain Orange County’s innovation and competitive edge in the changing global economy, Orange County jobs will require a higher number of STEM proficient students than is currently being prepared. At the national level, business leaders are warning that once the recession ends, they could face shortages in areas ranging from construction and energy to information technology, health care and the STEM fields. Even local STEM businesses have taken notice. One CEO from a Fortune 500 company with headquarters in Orange County has stated “If we can help keep students excited about mastering science, mathematics and engineering, we are helping to insure that our company and other great companies will benefit from the good works of these future scientists, engineers and innovators.”

The Georgetown University Center on Education and the Workforce has found that “the education system is not producing enough STEM-capable students to keep up with the demand both in traditional STEM occupations and other sectors across the economy that demand similar competencies.” Moreover, the demand for STEM competencies outside STEM occupations is growing.

These economic demands at the national, state and county levels will require an adaptable workforce – one with STEM competencies with a foundation of 21st Century skills required for citizenship, career development and lifelong learning.

The United States is undergoing a critical economic transformation, moving rapidly from a low-skill, low wage economy to a high-skill, knowledge-based economy driven by technology and innovation.

Source: Georgetown University Center on Education and the Workforce, 2011
The demand is not restricted to the fields of science, technology, engineering and math. Rather, workers with “STEM competencies” are needed across a broad range of occupations. STEM competencies include knowledge, skills and abilities such as active listening, critical thinking, problem solving and the ability to work collaboratively.

Nationally, STEM occupations are projected to grow more quickly than the economy as a whole (17% versus 10% through 2018) and will be the second-fastest growing occupational cluster, after Healthcare occupations.\textsuperscript{iv} In total, Orange County is expected to add approximately 135,500 jobs from 2008-18.

Overall STEM occupations pay well at all educational levels. People in STEM occupations with a high school diploma or less have higher lifetime earnings than people in other occupations with similar education levels (approximately $500,000 more). Similarly, STEM majors make substantially more over their lifetime than non-STEM majors.\textsuperscript{v}

The United States is not producing enough STEM workers to compete successfully in the global economy, despite the fact that STEM workers are in demand and paid comparatively higher wages.

Source: Georgetown University Center on Education and the Workforce
To develop STEM competent students and meet the demand of the 21st century economy, it will be critical to develop a framework that address the continuum of STEM teaching and learning from early childhood through higher education to employment in STEM related fields in Orange County. This continuum identifies those student, family and school supports and academic milestones for a child as he or she progress through each grade as a framework for STEM education in Orange County and recognizes the various pathways for students to attain STEM competencies.

**Early Learning – Early Opportunities that Build the Foundation of STEM Competencies**

Currently, California does not have a common standardized measure or any statewide data regarding school readiness in kindergarten. However, compelling evidence suggests that the achievement gaps that exist between student groups in 2nd grade are foreshadowed at kindergarten entry. vi

Research also suggests that very young children are ready to learn a broad array of mathematics content that will give them a solid base for future learning. vii Six longitudinal studies showed that early math skills are the most powerful predictor of later school success. viii

The development of STEM skills, such as critical thinking, is being formalized into preschool curriculums and within the early childhood development community, there is a greater emphasis on training teachers to teach STEM activities. According to one leading early childhood development expert, “Children are strong and natural explorers and even have some surprisingly abstract abilities for grasping basic scientific principles.” ix In a survey conducted in 2010, Californians reported seeing early science as foundational to success in high school. x

Elementary, Middle and High School – Reinforcement and Practice of STEM Competencies

According to the 2006 Programme for International Student Assessment (PISA), U.S. students performed much worse in science and math than students from other industrialized countries. Of the 30 countries tested, students from 16 countries performed higher than U.S. students in science, and students from 23 countries performed higher than the United States in math.\textsuperscript{xii}

In comparison, Orange County students outperform their statewide peers in mathematics and science, however disparities among districts remain. In 2010, 68\% of 2nd grade students and 57\% of 7th grade students in Orange County scored proficient or above on the Mathematics California Standards Tests (CST) compared to 62\% and 49\%, respectively, statewide. Orange County 5th, 8th and 10th grade students had a higher percentage of proficient and above performance on each of the Science CSTs than their peers statewide. Although Orange County students appear to outscore their statewide counterparts in Mathematics and Science CSTs, the results are inadequate.

Notwithstanding that Californians believe that science education is important and should be a priority for their, 40\% of elementary teachers say they spend 60 minutes or less teaching science each week and nearly one-quarter of middle school teachers may not have an adequate background or preparation for teaching the subject.\textsuperscript{xii} Something needs to change.

Research from the 2011 report “High Hopes – Few Opportunities: The Status of Elementary Science Education in California” indicate that at the elementary school level, teachers are under pressure to meet the accountability goals in mathematics and English, which limits time for science education.\textsuperscript{xiv} In addition, elementary teachers and schools do not have the infrastructure to support quality science learning.

Although middle schools offer dedicated time for science, access to facilities and teachers who have been prepared for science instruction, often times students arrive to middle school unprepared and uninterested in science.\textsuperscript{xiv}

Elementary School Science Education Findings

- Only one-third of elementary teachers say they feel prepared to teach science.
- 85\% of teachers say they have not received any professional development in science during the last three years.
- Nine in ten principals say science education is very important and should start early.
- Less than half of principals (44\%) believe it is likely that a student would receive high-quality science instruction in his or her school.

Source: The Center for the Future of Teaching and Learning at WestEd

Middle School Science Education Findings

- Nearly half (47\%) of principals report students’ lack of preparation as a major or moderate challenge.
- Nearly one-quarter of middle school teachers may not have an adequate background or preparation for teaching the subject.
- Nearly 60\% of surveyed teachers identified insufficient professional development as a barrier to high-quality science instruction.
- Just 14\% of middle school teachers provide a pattern of classroom practices that support regular engagement of students in the practices of science.

Source: The Center for the Future of Teaching and Learning at WestEd
Yet by high school, only 20% of Orange County students enroll in upper level math courses; while 14% of students enroll in Chemistry and 6% in Physics. There is ethnic disparity in both enrollment and performance. For example, Hispanic students comprise approximately 40% of the K-12 population, with a disproportionate rate of under-enrollment and under-performance in upper level math and science coursework.\textsuperscript{xv}

In 2009-10, approximately 36.2% of Orange County high school students were eligible for entry into the UC/CWU university systems, higher than the California rate of 35.6%.\textsuperscript{xvi} Asian students had the highest level of eligibility at 63% followed by Filipino students at 49.9% and White students at 40.8%. Latino students had the lowest rates of eligibility at 19.8%.

\textbf{Higher Education}

The “Biotechnology Career Ladder” graphic illustrates the importance of an education pathway from K-12 through higher education to workforce development.\textsuperscript{xvii} For this example, a person interested in the Biotech industry could meet job requirements through job training after high school. As the person advances, more knowledge and skills are warranted.

But, how is this accomplished with only 40% of 27 year olds nationally having earned an associate degree or higher?\textsuperscript{xxviii} Experts project that there will still be job openings for people with just a high school degree but the jobs will make up a small percentage of total job openings. In fact, over the past century, all of the net job growth in the United States has been generated by positions that
require at least some post-secondary education (community colleges, a four-year school, career technical education, or an apprenticeship).

In Orange County, 33.6% of students enrolled in Career Technical Education programs represented STEM related disciplines in 2010. Of the STEM disciplines, the three programs with the highest number of student enrollment were: Electrical, Electronics and Communications Engineering; Civil Engineering; and Mechanical Engineering. The California Community Colleges’ Career Technical Education provides education for technical skill demands of emerging industries, as well as basic work readiness skills that California’s employers need.

In 2010, only 4.8% of total associate degrees granted by Orange County Community colleges and WASC accredited non-public institutions were STEM related. Of those STEM related associate degrees, Mathematics, Chemistry and Biology accounted for 55.5% of all the STEM disciplines awarded.

In 2010, roughly 17% of total undergraduate and 22% of graduate degrees granted by Orange County universities were tech related.

Source: 2011-12 Orange County Workforce Indicators Report

The STEM pipeline carries students from high school through university and on to jobs in STEM. However, in Orange County and across the nation, the pipeline leaks students at multiple stages. This leakage is critical to understanding the need for a comprehensive education continuum approach for students to attain STEM competencies.
The number of STEM jobs in the United States is projected to grow by 17 percent between 2008 and 2018, compared with only 10 percent U.S. job growth overall. The number of jobs requiring STEM skills is even greater!

California’s economy is also becoming more knowledge-based, with STEM employment increasing at a faster rate than non-STEM employment. Between 1999 and 2007, STEM employment increased by 25% while non-STEM employment increased by only 16%. And even those traditional non-STEM jobs, such as those in the medical profession or business sector, will require a high level of critical thinking, and collaborative and innovative skills that can only be derived from a solid STEM-based education.

However, data suggests that the state’s supply of graduates in these fields is shrinking. While California ranked 4th on the 2010 State Technology and Science Index – performing well in risk capital, entrepreneurial infrastructure, and research and development inputs – the state’s lowest ranking was in human capital capacity, at 13th out of 50.

In Orange County, professions in eight of the 10 industry clusters as identified by the Orange County Workforce Investment Board require STEM competencies and skills. These industry clusters include: Management & Administration; Energy, Environment & Green Technologies; Construction; Finance, Insurance & Real Estate; Healthcare; Information Technology; Manufacturing; and Biotechnology & Nanotechnology. According to the 2011-12 Orange County Workforce Indicators Report, as many as 85 percent of all new jobs in Orange County from 2010-2020 will be in following six economic sectors: Healthcare, Business Services, Leisure and Hospitality, Construction, Manufacturing and Retailing.

The Orange County Business Council has identified International Trade, Information Technology, Creativity and Cleantech as emerging cluster drivers among the traditional clusters in 2010. These are clusters that created high-paying jobs and initiated economic growth throughout the County. Each of these clusters will require a STEM competent workforce to continue to meet the growing demand.
According to the 2011-12 Orange County Workforce Indicators Report, five of the 10 high growth occupations have salaries above $70,000. These occupations represent the High-Tech, Management and Administration, and Healthcare clusters. All of which require a level of STEM proficiency and skill.

Despite the potential lucrative nature of STEM careers and the increasing rate of STEM jobs, during this decade, the United States will produce twice as many graduates in social sciences and business as in STEM degrees. Orange County is no different. The rate of increase is outpaced by the rate of Orange County employers’ need for even greater numbers of STEM workforce.
## Blue Print for Success
### Organizational Structure

**Goal:** Build a sustainable structure to support the ongoing implementation of successful STEM programs

Learning from the Best of the Best

Quarterly Lecture Series: Quarterly meetings bring together members of the OC STEM Initiative and individuals interested in expanding and promoting STEM education in Orange County on a regular, scheduled basis. The series includes innovative speakers presenting on the newest technology and programs in the areas of Science, Technology, Engineering and Math and provides a platform for discussions among participants.

Building Partnerships, Building STEM

National Lab Network – Orange County: The existing STEM Volunteer and Mentor program was created to expose PreK-12 students and teachers to STEM professionals and project-based, inquiry-based learning. This early action project includes marketing the National Lab Network – Orange County, recruiting STEM businesses and educators to register on the website, assisting in the “matches” between STEM professionals and educators, and designing an evaluation.

STEM Learning and Teaching Resources for PreK-12 Educators: Through a partnership with the Silicon Valley Education Foundation, Gooru and OC STEM Initiative, this project will build upon the infrastructure of the Lessonopoly website and provide a more robust design, search engine power and increased functionality to Orange County educators.

Setting Teachers Up for STEM Success

Lead STEM Practitioners: This effort will launch a program wherein each Orange County school district designates a Lead STEM Practitioner (LSP) through an application process. Each LSP will participate in STEM-related trainings, be equipped with a tablet, and have access to an intranet site through the OC STEM website. The website will house STEM lesson plans, activities, and social networking functionality. LSPs will become the conduit for STEM information flowing from OC STEM to the districts and back, helping to increase awareness of STEM throughout all districts.

STEM for Preschoolers? There’s Jr. Higher-created App for That!

App Jam 2.0: In collaboration with the Donald Bren School of Information and Computer Sciences Student Council, this is designed to educate Orange County middle school student in the creation of mobile applications and in doing so, excite them about the opportunities available to them in the STEM fields. The project pairs undergraduate level computer science students with middle school students in the creation of STEM related mobile applications for early learners. The winning apps would be brought to market through the Android or Apple platforms.
ocstem.org: the Go-To Place for STEM in Orange County

ocstem.org is Orange County's comprehensive website for all things STEM – programs, events, partners, articles, news and more. The website acts is the main conduit of STEM information in the county. In the next year, the website will house the Lead STEM Practitioner Program’s intranet site, OC STEM Initiative member’s intranet site for schedule of meetings and events plus other additional project management information, and a fully functioning National Lab Network database with links to YouTube, Facebook and other social media platforms.

Leveraging Our Dollars and Relationships to Bring STEM to Orange County

An important role for the OC STEM Initiative will be to seek funding and support for STEM programs within Orange County. This includes seeking funding opportunities at the Federal, state and local levels by leveraging relationships and expertise. This includes supporting the Santa Ana Unified School District's grant submission for the Investing in Innovation Fund (i3) through the US Department of Education, which, if awarded, would expand MIND Research Institute’s PreK Math Program throughout the Santa Ana Unified School District.

The OC STEM Initiative is a regional alliance of the California STEM Learning Network, whose mission is to build a network of educators, business leaders and other stakeholders committed to establishing the world’s best STEM education system in California. As a member of the network, the OC STEM Initiative is able to leverage key relationships with other STEM regions throughout the state. For example, the OC STEM Initiative was able to support 10 Orange County Boys & Girls Clubs participation in the Boston Museum of Science’s national pilot study of a four unit curricula that exposes 3rd-5th grade students on the engineering design process through hands-on activities. The pilot began in January 2012, concluding by the end of the school year.

The OC STEM Initiative is also part of the California Afterschool Network’s STEM in Out-of School Time program which is working to increase opportunities for high quality STEM learning for youth throughout the state. Because of the involvement of the OC STEM Initiative in the program, Orange County was a pilot site for an afterschool STEM program, which will run 2011-12.

Starting the Drumbeat

The OC STEM Initiatives looks to support STEM focused events and meetings that help support its vision. For example, in February 2012 in partnership with the National Science Resources Center, Science@OC, Orange County Department of Education, the Synergy for Success in Science Education brought together 15 leadership/district teams, consisting of superintendents, science educators, science curriculum specialists, and local business partners, to begin a dialogue and framework that addresses science education across their districts. In April, in partnership with the California STEM Learning Network and the Heising-Simons Foundation, the Early Math Learning and Teaching convening was hosted at the University of California Irvine’s Department of Education. The full day event brought together early math research experts with professionals representing counties throughout southern California to discuss the latest findings and begin to dialogue about next steps at the state and local levels. The OC STEM Initiative will continue to look for opportunities to support such events.
